Data models AutoCAD Free Download uses two data models. The first is object-oriented and records a CAD document. The second is a two-dimensional graph of points, lines, circles and text, and is used by its graphics subsystem. Object-oriented model When the drawing is opened, it is populated with a set of objects. These objects, with a few exceptions, are immutable. Any change of value or property of an object is an error and can cause the CAD document to crash. The most important CAD object is the block. A block is a rectangle of 1 inch (25 mm) square, divided into 16 regions, each 8.5×11 inches in size. A region is defined by one or more blocks and contains one or more linear or non-linear lines. The region is what a person works on when the drawing is being edited or created. The drawing can have multiple regions that can overlap each other. Each block has a unique name, a position (x, y) and a rotation (rotation angle). A block can have a number of attributes such as color, linetype, text (such as titles, captions, and keywords), and so on. A block can also be a layer, the current layer, a profile, an item, and a property. Each block can be connected to other blocks or objects using connectors. A connector creates a line or polyline between two objects. The distance between the line and the objects must be set. Connectors can also be symbols or shapes, such as arrows or lines with flags or attributes. To distinguish objects from other objects, AutoCAD has several visual attributes, and it assigns colors to blocks based on their visual attributes. When multiple blocks are selected, the user can apply visual and non-visual effects to the selected blocks. These include highlights, text, text properties, symbol effects, and more. Linear objects In addition to the blocks, the drawing can have several linear objects. Lines are two-dimensional entities with a start and an end point. They can be curved or straight. A line segment is a line between two points, a line is a line segment from a line to a point, and a circular arc is a line segment from a point to a circle. Lines are extended to create text, splines and curves. Text and splines are the two basic visual types of lines. A text is a type of line af5dca3d97
